# We put a lot of energy into Northern Maine

#### MAINE PUBLIC SERVICE

P.O. Box 1209 · Presque Isle, ME 04769-1209

The results of the walk-through audit performed for NMCC are as follows:

Listed on the enclosed spread sheet you will find, at the top of the sheet, areas such as:

- 1. location:
- 2. quantity: number of fixtures,
- 3. type of fixture,
- 4. convert to: what you should be using,

### Lighting:

The CFL's (Compact Fluorescent Lamp) is taking the place of the incandescent lamp. The CFL is at least 75% more energy efficient and last 6 to 9 times the life of the incandescent lamp. See spread sheet for locations.

There are a number of old F96T12 fixtures and they should be replaced with the new T8 retro fit lamps and electronic ballast or replace with new T5 fixtures. The T5 lamps will not fit in the old T12 or T8 fixtures. Enclosed you will find a copy of the comparisons between the T8's and the T5 HO's. At this time, staying with the T8 fixture at this time is more economical than changing to the T5 system. See insert:

There are a number of areas that could and should have Motion Sensors installed (see spread sheet). When someone moves into the range area of the sensor the sensor turns the lights on and after (around 15 minutes) if the sensor does not sense movement or heat, the sensor will turn the lights off, saving energy and lowering your energy bill.

#### **HVAC:**

Set thermostats for energy economy;

A comfortable setting is around 76 - 78 degrees in the cooling season.

If you have an inaccurate thermostat, you could be wasting a lot of energy. Check you thermostat against a thermostat you're sure is correct. If the temperature is off by 3 degrees, setting your thermostat at 81 degrees will give you a true 78 degree temperature.

Eliminate unnecessary HVAC use during unoccupied hours by using a programmable 7 day timer. During the day the HVAC will operate, but after hours the system shuts down.

### Office Equipment:

Turn off PC's, monitors, printers, and copiers every night and weekend. Laptop computers consume 90% less energy than the standard desktop computers. Buy only *ENERGY STAR* PC's monitors, printers and copiers.

We had placed test meters on two soda machines and one ice maker. Their findings are: one soda machine was \$55 and the other was \$53 per month to operate. The ice-maker was \$70 per month. Enclosed you will find some material in regards to a (VendingMiser).

The weather-stripping for all doors should be checked to make sure there is <u>no daylight</u> showing around the edges of the doors. If you can see daylight, then cold air can penetrate into the building, causing higher heating cost during the heating season.

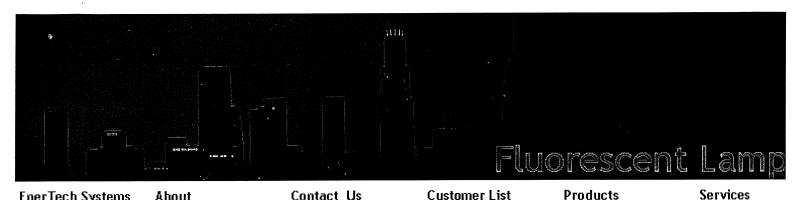

Windows should be up graded when ever possible or if the windows are close to the ceiling, they should be removed and insulated and covered. A single pane window has an R-value of one and a wall (minimum) around R-13 to R-19.

Enclosed is a booklet (Energy Efficiency Pays). A number of ways to help improve on the efficiency of your lighting and other areas.

If you have any questions or require further assistance, please do not hesitate to contact me.

# Fluorescent Lamps

Fluorescent lamps are ever changing. Manufactures are producing longer life, lower watta and brighter lamps almost weekly. So which lamps is right for you? At EnerTech Systems v on top of this ever changing market place so we can find the option that best suites your need

## T12 Lamps

T12 Lamps are the dinosaurs of the group. You can identify these lamps one of two ways

- 1. They are  $1^{-1}/_{2}$  inches in diameter.
- 2. The code on the lamp will say something like F40/CW or F34/WW.

If you have these lamps you are an excellent candidate for a lighting retrofit.

# T8 Lamps

T8 Lamps have become the industry standard for energy efficiency. EnerTech install T8 in place of T12 lamps because of all of the advantages, (see T12 vs. T8). To identify if you be T8 lamps try one of these two methods:

- 1. The diameter of the lamps is 1 inch.
- 2. The code on the lamp will say something like F32/741.

If you have T8 lamps your lighting system is more efficient than a comparable one that ha lamps, but it may not be as efficient as it can be. Numerous lighting retrofit companies would relamp going lamp for lamp. In doing so you are reducing you electrical bill, but you are not optimizing your lighting system. If you have T8 lamps from a retrofit performed three (3) or years ago, the company that performed your retrofit replaced everything lamp for lamp, or if just had new fixtures installed, call EnerTech. We can show you how we can further reduce y electrical bill while still providing you with an exceptional payback.

# T5 Lamps

T5 Lamps are relatively new in the market, but they have been around for a number of year They normally are not used in standard retrofits because they only come in metric lengths, we are slightly shorter or longer than conventional T12 or T8 lamps. These lamps are also extremely bright and as a result typically used in fixtures where you are unable to see the lamp. A great application for these lamps has been in fixtures that replace high bay metal halide fixtures.

This building has an electric water heater.

This building should be renovated or torn down and a new one constructed in its place. Using your building trades people and using the new standards of today.

This building is in no way energy efficient except for the lighting..

FOOTO
